

Contents of R Script on multivariate descriptive statistics

In the script **Desc_multivariate.R** you will find examples of:

- Computing mean vectors, covariance and correlation matrices.
- Classic test on a correlation coefficient.
- Visualizing correlations (libraries `corrplot` and `corrgram`).
- Computing partial correlations and visualizing them.
- Defining a function for the squared multiple correlation coefficient (R-squared).
- Eigenvalue analysis of matrix S (or R).
- Testing normality (univariate and multivariate).
- Transformation to improve normality (library `car`, function `powerTransform`).
- Outliers detection, univariate and multivariate.
